

Population pyramids of some "B-countries"

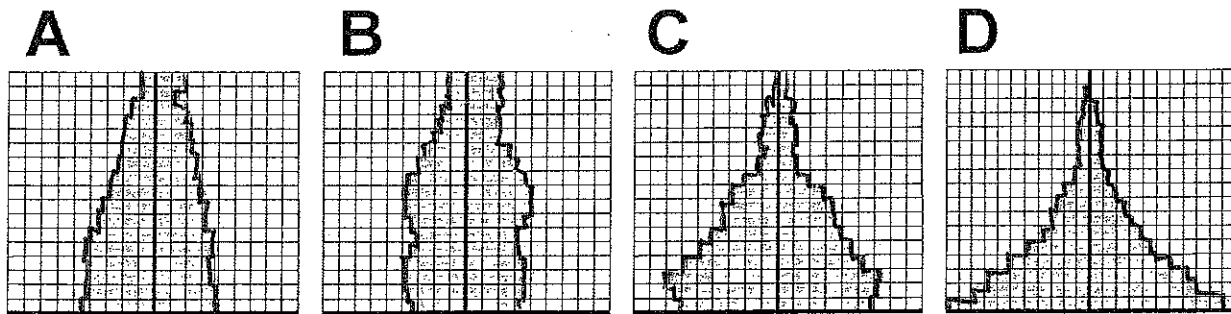

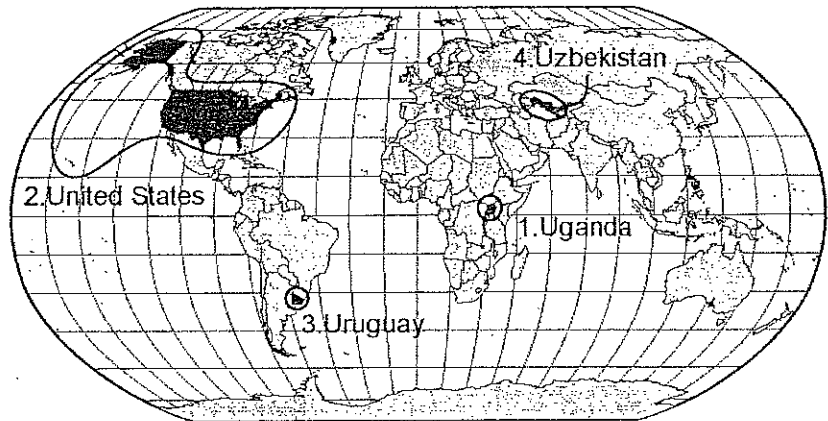

The four population graphs below correspond to the four countries highlighted at right. Read the descriptions of the countries and try to figure out which graph describes each country. Explain your logic in the space below the paragraphs or in a short essay on a separate piece of paper.

- 1. Bangladesh is about the size of Iowa but has 50 times as many people. It has a long growing season, monsoon rain, and fertile floodplain soil. Two thirds of the people are farmers, but they cannot grow all of the food the country needs. Bangladesh has recently become an exporter of clothing, shoes, and other factory products; both men and women work in the factories.
- 2. Belgium is about the size of Maryland but has twice as many people. It is farther from the equator than any state except Alaska, but the nearby ocean keeps it from getting too cold. Only two percent work in agriculture, but they use machines and chemicals to grow many valuable products. More than 70 percent work in services such as banking, medicine, and government.
- 3. Bulgaria is a bit larger than Virginia in both area and population. The climate is like northern California, with hot, dry summers and mild, rainy winters. About one third of the people work as farmers and another third work in factories. After the breakup of the Soviet Union, the economy had serious inflation and loss of production, which made many people afraid of the future.
- 4. Burundi is slightly larger than Vermont but has 10 times as many people. It is warm and rainy all year, because it is located just a few degrees south of the equator. Nearly three fifths of the people are farmers who grow most of their own food. Annual money income per person is less than a thousand dollars, and educational and medical systems are not well developed.

Population pyramids of some "U-countries"

The four population graphs below correspond to the four countries highlighted at right. Read the descriptions of the countries and try to figure out which graph describes each country. Explain your logic in the space below the paragraphs or in a short essay on a separate piece of paper.

- 1. Uganda is about the size of Oregon but has 7 times as many people. Although it is located close to the equator, much of the country has a pleasantly warm (not hot) climate, because it is high above sea level. Seven eighths of the people are farmers, and many of them grow their own food. The country is a major exporter of coffee, but income per person is very low.
- 2. The United States has 280 million people and a wide range of natural environments. Barely 2 percent of the workers are farmers, but they produce plenty of food for the entire country and a considerable amount for export. About one fourth work in factories, and the rest are in services such as medicine, education, or research. The country had a "baby boom" after World War II.
- 3. Uruguay is about the size of Washington but has only half as many people; there is no city like Seattle in this country. Climatically, Uruguay is like North Carolina, with hot summers, mild winters, and rain in every season of the year. About one tenth of the labor force is in agriculture and two tenths in factories. The country is an exporter of meat, leather, shoes, wool, and clothing.
- 4. Uzbekistan is similar to California in size and population. Like California, much of it is mountain or desert, but the climate is colder and drier, more like Utah. Nearly half of the workers earn their living on farms. The country became a major producer of irrigated cotton when it was part of the Soviet Union, but its economy suffered in post-Soviet times, and it has to import food.
